# What's mathematical optimization anyway?

## Mathematical Optimization

Using R to  
model  
optimization  
problem

“Optimization” comes from the same root as “optimal”, which means best. When you optimize something, you are “making it best”.

But “best” can vary. If you’re a football player, you might want to maximize your running yards, and also minimize your fumbles. Both maximizing and minimizing are types of optimization problems.

# Mathematical Optimization in the “Real World”

Mathematical  
Optimization

Using R to  
model  
optimization  
problem

Mathematical Optimization is a branch of applied mathematics which is useful in many different fields. Here are a few examples:

- Manufacturing
- Production
- Inventory control
- Transportation
- Scheduling
- Networks
- Finance
- Economics
- Control engineering
- Marketing
- Policy Modeling
- Mechanics

# Optimization Model Components

Mathematical Optimization

Using R to model optimization problem

Your basic optimization problem consists of:

- 1 The objective function,  $f(x)$ , which is the output you're trying to maximize or minimize. e.g. maximize the gross profit margin; minimize travel distance of a pizza delivery car.
- 2 Variables,  $x_1, x_2, x_3$  and so on, which are the inputs – things you can control.
- 3 Constraints, which are equations that place limits on how big or small some variables can get. e.g. The pizza delivery should be on time.

# Optimization Example

A football coach is planning practices for his running backs.

- His main goal is to maximize running yards – this will become his **objective function** .
- He can make his athletes spend practice time in the weight room; running sprints; or practicing ball protection. The amount of time spent on each is a **variable**.
- However, there are limits to the total amount of time he has. Also, if he completely sacrifices ball protection he may see running yards go up, but also fumbles, so he may place an upper limit on the amount of fumbles he considers acceptable. These are **constraints**.

Note that the variables influence the objective function and the constraints place limits on the domain of the variables.

optimization  
problem

In this slide, some important text will be **highlighted** because it's important. Please, don't abuse it.

## Remark

Sample text

## Important theorem

Sample text in red box

## Examples

Sample text in green box. The title of the block is “Examples”.

# Two-column slide

Mathematical  
Optimization

Using R to  
model  
optimization  
problem

This is a text in first column.

$$E = mc^2$$

- First item
- Second item

This text will be in the second column and on a second thought this is a nice looking layout in some cases.
